Modeling with Polynomial Functions

**GOAL 1** **USING FINITE DIFFERENCES**

You know that two points determine a line and that three points determine a parabola. In Example 1 you will see that four points determine the graph of a cubic function.

**EXAMPLE 1** **Writing a Cubic Function**

Write the cubic function whose graph is shown at the right.

**Solution**

Use the three given x-intercepts to write the following:

\[ f(x) = a(x + 3)(x - 2)(x - 5) \]

To find \( a \), substitute the coordinates of the fourth point.

\[ -15 = a(0 + 3)(0 - 2)(0 - 5), \text{ so } a = -\frac{1}{2} \]

\[ f(x) = -\frac{1}{2}(x + 3)(x - 2)(x - 5) \]

**CHECK** Check the graph’s end behavior. The degree of \( f \) is odd and \( a < 0 \), so \( f(x) \rightarrow +\infty \) as \( x \rightarrow -\infty \) and \( f(x) \rightarrow -\infty \) as \( x \rightarrow +\infty \).

To decide whether y-values for equally-spaced x-values can be modeled by a polynomial function, you can use **finite differences**.

**EXAMPLE 2** **Finding Finite Differences**

The first three triangular numbers are shown at the right. A formula for the \( n \)th triangular number is \( f(n) = \frac{1}{2}(n^2 + n) \).

Show that this function has constant second-order differences.

**Solution**

Write the first several triangular numbers. Find the first-order differences by subtracting consecutive triangular numbers. Then find the second-order differences by subtracting consecutive first-order differences.

\[
\begin{array}{cccccccc}
1 & 3 & 6 & 10 & 15 & 21 & 28 \\
2 & 3 & 4 & 5 & 6 & 7 \\
1 & 1 & 1 & 1 & 1 & 1 \\
\end{array}
\]

**Function values for equally-spaced \( n \)-values**

**First-order differences**

**Second-order differences**
In Example 2 notice that the function has degree *two* and that the second-order differences are constant. This illustrates the first property of finite differences.

**PROPERTIES OF FINITE DIFFERENCES**

1. If a polynomial function \( f(x) \) has degree \( n \), then the \( n \)th-order differences of function values for equally spaced \( x \)-values are nonzero and constant.

2. Conversely, if the \( n \)th-order differences of equally-spaced data are nonzero and constant, then the data can be represented by a polynomial function of degree \( n \).

The following example illustrates the second property of finite differences.

**EXAMPLE 3**

**Modeling with Finite Differences**

The first six triangular pyramidal numbers are shown below. Find a polynomial function that gives the \( n \)th triangular pyramidal number.

\[
\begin{array}{cccccccc}
& \text{Function values} & \quad & \text{First-order differences} & \quad & \text{Second-order differences} & \quad & \text{Third-order differences} \\
\text{for equally-spaced} & 1 & 4 & 10 & 20 & 35 & 56 & 84 \\
\text{\( n \)-values} & & & & & & & \\
1 & 4 & 10 & 20 & 35 & 56 & 84 \\
3 & 6 & 10 & 15 & 21 & 28 \\
3 & 4 & 5 & 6 & 7 \\
1 & 1 & 1 & 1 & \\
\end{array}
\]

**SOLUTION**

Begin by finding the finite differences.

\[
\begin{array}{cccccc}
& f(1) & f(2) & f(3) & f(4) & f(5) & f(6) & f(7) \\
1 & 4 & 10 & 20 & 35 & 56 & 84 \\
3 & 6 & 10 & 15 & 21 & 28 \\
3 & 4 & 5 & 6 & 7 \\
1 & 1 & 1 & 1 & \\
\end{array}
\]

Because the third-order differences are constant, you know that the numbers can be represented by a cubic function which has the form \( f(n) = an^3 + bn^2 + cn + d \).

By substituting the first four triangular pyramidal numbers into the function, you can obtain a system of four linear equations in four variables.

\[
\begin{align*}
  a(1)^3 + b(1)^2 + c(1) + d &= 1 \quad \rightarrow \quad a + b + c + d = 1 \\
  a(2)^3 + b(2)^2 + c(2) + d &= 4 \quad \rightarrow \quad 8a + 4b + 2c + d = 4 \\
  a(3)^3 + b(3)^2 + c(3) + d &= 10 \quad \rightarrow \quad 27a + 9b + 3c + d = 10 \\
  a(4)^3 + b(4)^2 + c(4) + d &= 20 \quad \rightarrow \quad 64a + 16b + 4c + d = 20 \\
\end{align*}
\]

Using a calculator to solve the system gives \( a = \frac{1}{6}, b = \frac{1}{2}, c = \frac{1}{3} \), and \( d = 0 \).

The \( n \)th triangular pyramidal number is given by \( f(n) = \frac{1}{6}n^3 + \frac{1}{2}n^2 + \frac{1}{3}n \).
In Examples 1 and 3 you found a cubic model that exactly fits a set of data points. In many real-life situations, you cannot find a simple model to fit data points exactly. Instead you can use the regression feature on a graphing calculator to find an \( n \)-th-degree polynomial model that best fits the data.

**EXAMPLE 4**  **Modeling with Cubic Regression**

**BOATING** The data in the table give the average speed \( y \) (in knots) of the *Trident* motor yacht for several different engine speeds \( x \) (in hundreds of revolutions per minute, or RPMs).

a. Find a polynomial model for the data.

b. Estimate the average speed of the *Trident* for an engine speed of 2400 RPMs.

c. What engine speed produces a boat speed of 14 knots?

**SOLUTION**

a. *Enter* the data in a graphing calculator and make a scatter plot. From the scatter plot, it appears that a cubic function will fit the data better than a linear or quadratic function.

*Use* cubic regression to obtain a model.

\[
y = 0.00475x^3 - 0.194x^2 + 3.13x - 9.53
\]

*CHECK* By graphing the model in the same viewing window as the scatter plot, you can see that it is a good fit.

b. Substitute \( x = 24 \) into the model from part (a).

\[
y = 0.00475(24)^3 - 0.194(24)^2 + 3.13(24) - 9.53
\]

\[
= 19.51
\]

The *Trident*’s speed for an engine speed of 2400 RPMs is about 19.5 knots.

c. Graph the model and the equation \( y = 14 \) on the same screen. Use the *Intersect* feature to find the point where the graphs intersect.

An engine speed of about 2050 RPMs produces a boat speed of 14 knots.
**1.** Describe what first-order differences and second-order differences are.

**2.** How many points do you need to determine a quartic function?

**3.** Why can’t you use finite differences to find a model for the data in Example 4?

**4.** Write the cubic function whose graph passes through (3, 0), (−1, 0), (−2, 0), and (1, 2).

Show that the $n$th-order finite differences for the given function of degree $n$ are nonzero and constant.

**5.** $f(x) = 5x^2 − 2x + 1$

**6.** $f(x) = x^3 + x^2 − 1$

**7.** $f(x) = x^4 + 2x$

**8.** $f(x) = 2x^3 − 12x^2 − 5x + 3$

Use finite differences to determine the degree of the polynomial function that will fit the data.

### Practice and Applications

**Writing Cubic Functions** Write the cubic function whose graph is shown.

**14.**

**15.**

**16.**

**Finding a Cubic Model** Write a cubic function whose graph passes through the given points.

**17.** (−1, 0), (−2, 0), (0, 0), (1, −3)  
**18.** (3, 0), (2, 0), (−3, 0), (1, −1)

**19.** (1, 0), (3, 0), (−2, 0), (2, 1)  
**20.** (−1, 0), (−4, 0), (4, 0), (0, 3)

**21.** (3, 0), (2, 0), (−1, 0), (1, 4)  
**22.** (0, 0), (−3, 0), (5, 0), (−2, 3)
**Finding Finite Differences** Show that the \( n \)th-order differences for the given function of degree \( n \) are nonzero and constant.

23. \( f(x) = x^2 - 3x + 7 \)  
24. \( f(x) = 2x^3 - 5x^2 - x \)  
25. \( f(x) = -x^3 + 3x^2 - 2x - 3 \)

26. \( f(x) = x^4 - 3x^3 \)  
27. \( f(x) = 2x^4 - 20x \)  
28. \( f(x) = -4x^2 + x + 6 \)

29. \( f(x) = -x^4 + 5x^2 \)  
30. \( f(x) = 3x^3 - 5x^2 - 2 \)  
31. \( f(x) = -3x^2 + 4x + 2 \)

**Finding a Model** Use finite differences and a system of equations to find a polynomial function that fits the data. You may want to use a calculator.

32.

43.  

**Pentagonal Numbers** The dot patterns show pentagonal numbers. A formula for the \( n \)th pentagonal number is \( f(n) = \frac{1}{2}n(3n - 1) \). Show that this function has constant second-order differences.

44. **Hexagonal Numbers** A formula for the \( n \)th hexagonal number is \( f(n) = n(2n - 1) \). Show that this function has constant second-order differences.

45. **Square Pyramidal Numbers** The first six square pyramidal numbers are shown. Find a polynomial function that gives the \( n \)th square pyramidal number.

\[
\begin{align*}
&f(1) = 1 \quad f(2) = 5 \quad f(3) = 14 \quad f(4) = 30 \quad f(5) = 55 \quad f(6) = 91 \quad f(7) = 140
\end{align*}
\]
**FINDING MODELS** In Exercises 47–49, use a graphing calculator to find a polynomial model for the data.

47. **GIRL SCOUTS** The table shows the number of Girl Scouts (in thousands) from 1989 to 1996. Find a polynomial model for the data. Then estimate the number of Girl Scouts in 2000.

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of Girl Scouts</th>

<td>6</td>
</tr>
</tbody>
</table>

a. Use finite differences to find a polynomial model for each business.

b. **Writing** You want to choose the business that will make the greater profit in December (when \( t = 12 \)). Explain which business you should choose and why.

51. a. Substitute the expressions \( x, x + 1, x + 2, \ldots, x + 5 \) for \( x \) in the function \( f(x) = ax^3 + bx^2 + cx + d \) and show that third-order differences are constant.

b. The data below can be modeled by a cubic function. Set the variable expressions you found in part (a) equal to the first-, second-, and third-order differences for these values. Solve the equations to find the coefficients of the function that models the data. Check your work by substituting the original data values into the function.
